

Date: 10/09/25 TASK - 7

Utilizing Functions concepts in Python programming

(a) Banking Transaction System

AIM:

Create Python program using functions to manage banking transactions like deposit, withdrawal and balance check.

ALGORITHM:

1. Initialize account balance
2. Define functions for deposit, withdrawal, and checking balance.
3. Handle user input for transactions.

Program:

```
def deposit(amount):
```

```
    global balance
```

```
    balance += amount
```

```
    print(f"Deposit {amount} : New balance: {balance}")
```

```
def withdraw(amount):
```

```
    global balance
```

```
    if amount <= balance:
```

```
        balance -= amount
```

```
    print(f"Withdraw {amount} : New balance: {balance}")
```

```
else:
```

```
    print("Insufficient balance.")
```

OUT PUT

Deposited 1000. New balance : 1000

Withdrawn 500. New balance 500

Current balance: 500

TX NO.	
APR 1980 - CSE	

def check - balance():

print(f"Current balance: {balance}")

sample usage

deposit(1000)

withdraw(500)

check - balance()

Result

The python program for Balancing transaction system has been developed using functions and successfully executed

Date: 10/09/25 Task - 2

(b) Student Result Calculator

AIM:

Create a python program using functions to calculate student results based on marks of 3 subjects.

ALGORITHM:

1. Accept marks of 3 subjects
2. Calculate total marks, average, and grade.
3. Display results using a separate function.

Program

```
def get_marks():
```

```
    marks = []
```

```
    for subject in range(3):
```

```
        mark = float(input(f"Enter marks for subject {subject+1}:"))
```

```
        marks.append(mark)
```

```
    return marks
```

```
def calculate_results(marks):
```

```
    total = sum(marks)
```

```
    average = total / len(marks)
```

```
    grade = 'A' if average >= 80 else 'B' if average >= 60
```

```
    else 'C' if average >= 40 else 'Fail'
```

```
    return total, average, grade
```

OUTPUT

Total = 240

Average = 80.0

Grade = A

```
def display - result (total, average, grade):
    print (f"Total: {total}")
    print (f"Average: {average}")
    print (f"Grade: {grade}")
```

Sample Usage

marks = get_marks()

total, average, grade = calculate_result(marks)

display - result (total, average, grade)

VEL TECH - CSE	
EX NO.	
PERFORMANCE (5)	3
RESULT AND ANALYSIS (5)	5
VIVA VOCE (5)	5
RECORD (5)	2
TOTAL (20)	15
SIGN WITH DATE	

RESULT:

The Student Result calculator takes student marks as input and computes the total, average and grade. It shows total marks obtained & calculator average score. Successfully done.
